Wireless Seismic Receives Expanded FCC Certification for Unrestricted Communications

Houston, Texas - Wireless Seismic Inc., developer of the RT 1000, an innovative wireless data acquisition system, offering the real-time return of seismic data, today announced that the Federal Communication Commission (FCC) has re-certified the RT 1000 for operation anywhere in the 2.403 GHz to 2.478 GHz range of the 2.4 GHz "unlicensed" band. This certification complements an earlier certification allowing operation within a smaller portion of the band and now allows the system to deliver the full spectrum of interference-resistance to customers.

"Securing this re-certification of the RT 1000 system with this expanded range of operating frequencies will have no noticeable effect in most common operating environments. However, this extended license will provide the system with additional operating flexibility, especially in some of the more challenging environments", said Mick Lambert, Chief Operating Officer of Wireless Seismic.

About Wireless Seismic

Wireless Seismic was formed in 2006 to develop and introduce the RT 1000, a revolutionary seismic data acquisition system to the exploration and production industry, that capitalizes on emerging technologies in the seismic, wireless and mesh-network industries. Its financial backers include Chesapeake Energy Corporation, one of the largest producers of natural gas and the largest user of seismic data in the United States, and Energy Ventures, an independent venture capital firm dedicated to upstream oil and gas investments. Further information on Wireless Seismic is available at www.WirelessSeismic.com.
